

ISO 20022 Interbank Financial Services Messaging Schemas

Complete Architectural Reference for pacs.008, pacs.002, pain.001 & camt.053 XML Schemas

Standard Setter:	International Organization for Standardization (ISO TC68 / SC7)
Specification ID:	ISO-20022-CAT-2026
Classification:	Global Universal Financial Industry Message Scheme
Verification:	Integrated in Ariya Sarrafzadeh Production Architecture

1. Message Family Architecture

ISO 20022 organizes financial communications into discrete business domains: pacs (Payments Clearing & Settlement), pain (Payment Initiation), camt (Cash Management), and admi (Administration).

2. pacs.008: Financial Institutional Customer Credit Transfer

The core interbank transfer schema containing rich unstructured and structured remittance information, Ultimate Debtor/Creditor tags, End-to-End Identification (E2E ID), and Universal End-to-End Transaction Reference (UETR).

3. pacs.002: Payment Status Report

Real-time settlement status updates carrying definitive business status codes (ACTC: Accepted Technical Validation, ACSC: Accepted Settlement Completed, RJCT: Rejected) with granular reason codes.

4. Strict Validation & Schema Invariants

All messages must validate against published XSD definitions. Systems employ in-memory XML streaming validators to ensure strict UTF-8 compliance, structural schema parity, and sub-5ms processing latencies.

Systems Verification Notice: This authoritative specification establishes the invariant compliance baseline for production fintech switches, settlement reconciliation engines, and double-entry ledger implementations documented across the portfolio.
